China: Learning To Control Construction Growth	25X
Summary	
over long-term growth plans by fueling inflation, undermining critical infrastructure projects, and straining resources. The growth of nonbudgeted construction—largely in the consumer and processing industries—has forced Beijing to increase its reliance on poorly developed macroeconomic levers to control expenditures. Budget cuts are a less attractive option, for budgeted projects consist largely of crucial infrastructure projects. Beijing has now taken a firmer hand, directing cutbacks in specific projects and increasing the banking sector's role in allocating funds. Because Beijing does not have the expertise or information to control spending through the banking system, we expect construction growth to remain a headache for economic planners at least through next year.	25X

25X1

^{*} Provisional Data.

^{**} Estimated. These estimates almost certainly understate capital construction financed by collectives and individuals. They are derived from State Statistical Bureau data (available only after 1983) for collectives' and individuals' total investment in fixed assets—of which capital construction is a subset with no data provided. As a conservative measure, we assumed that capital construction's share of total fixed asset investment in these sectors was comparable to that in the state sector. Actually, because collective industry is usually more labor intensive, more of collectives' fixed assets investment goes into capital construction (buildings) and less into machinery and equipment. Most fixed assets investment by individuals (68 percent) goes into residential construction with little into machinery. Thus the capital construction shares of fixed asset investment in these sectors are almost certainly higher.

Although Beijing has expressed limited satisfaction with this growth rate—substant lower than the 1985 growth rate of 44 percent—we believe this figure seriously understates actual expenditures. Beijing has admitted in the press that state firms seeking to avoid project cancellations or postponements often disguised new proje by labeling them renovations, a separate item in the budget excluded from construction controls. If we include the 45-percent growth in renovations in the first three quart of 1986 over the same period in 1985, we estimate that capital construction this y has grown by as much as 21 percent.	cts , ction
Measures To Trim Budgeted Construction	·
In August, reacting to sustained growth in construction expenditures, Beijing announced plans to review all outstanding construction projects by state-owned enterprises. During the ensuing three months, the State Planning Commission chec projects for feasibility, availability of materials and funding, level of embodied technology, and the extent of duplication of projects nearby. Following review, proj were considered for funding reductions, postponements, or cancellations. Beijing announced in November that the number of projects under construction through September had been cut by 3,700 from 1985; the number of new projects begun in was down by over 7,500. The total number of projects outstanding was not given, on the basis of State Statistical Bureau data listing more than 69,000 projects under construction by state enterprises in 1984, we estimate the project cancellation rate only about 5 percent.	ects 1986 but
Even these numbers may overstate how much China has cut back construction activity. Beijing has admitted that its efforts to cancel excess projects in the 1982—budgets were frequently thwarted at the local level, where officials used "cost overrat projects still on the books to sustain construction of projects Beijing had ordered canceled. In the current cutback effort, press reports claim that "not a few" localities and departments purposely submitted incomplete lists of projects for central review avoid cancellations and postponements of many costly items.	on 83 uns"
Using the Finance Sector To Control Extrabudgetary Construction	
With off-budget funds now financing nearly three-fourths of China's capital construction, Chinese financial authorities recognize the need to monitor funds and deposits by local banks, and to maintain checks and balances on both banks and borrowers.	25X [.]
Through early 1985, the People's Bank of China (PBOC) tried to curb loan expansion by:

		25X1
	 Raising interest rates on loans for both construction (up to 10.08 percent for five-year loans) and working capital (up to 7.92 percent). 	
	 Restricting loan disbursements to collectives to 50 percent of project costs. 	
	 Requiring that applications for off-budget construction loans be accompanied by deposits equal to 30 percent of the value of the loan sought. 	25X1
	For highly profitable enterprises flush with funds, however, these restrictions	
	probably have done little to discourage further investment.	25X1
	At the same time, according to economic journals, China's financial system offered banks little incentive to follow central guidelines on credit control. No meaningful penalties existed for exceeding credit limits; local banks could borrow money at low rates from the PBOC and make substantial profits by relending it to enterprises. Although the PBOC disapproved of the practice, its accounting mechanisms were insufficient to monitor local bank activities. Moreover, local banks, under pressure from provincial and city governments not to cramp expansion plans, often failed to collect taxes on local funds available for construction, or taxed all enterprises uniformly at the	0574
	minimum rate.	25 X 1
	China has indicated that in August it finally took steps to control lenders as well as borrowers. The PBOC has reduced incentives for local banks to run up excess loans by raising the cost of PBOC funds to banks by as much as 6 percentage points. Temporary loans—borrowings from the PBOC intended to allow local banks to meet emergency cash shortages—can no longer be extended indefinitely, reducing their abuse by local banks as an additional source of money for loans to enterprises. Finally, the PBOC raised by 1.4 percentage points the interest rate paid to banks on their deposits of excess reserves with the PBOC; this reduced the	25X1
	advantage to the local bank of lending that money.	25X1
	On the Right Course	
	Although these measures are a step in the right direction, we doubt that Beijing will gain control of capital construction in the short term. To restrain nonbudgeted projects, the PBOC needs better control over—and better accounting information about—local banks' activities to make certain that credit limits are observed and that borrowers conform to central bank lending regulations. Moreover, the Chinese will find it increasingly difficult to cut budgeted projects, which focus on crucial infrastructure projects. Chinese economic journals, for example, have emphasized that Beijing will allocate a much larger share of budgeted construction in the Seventh Five—Year Plan to energy and transport. As a result, until China develops the macroeconomic levers to control spending, we expect the dangers of excess construction activity—inflation, shortages, and delays for key projects—to pose continuing problems for China's modernization strategy.	25 X 1
